

# How Do You Solve a System of Equations by Substitution?

$$3x + 2y = 10$$

$$2x - y = 9$$

\* Try to pick a variable with a coefficient of 1\*

1<sup>st</sup> Choose one equation and solve for x or y. With a coefficient of

$$\begin{array}{r} 2x - y = 9 \\ -2x \quad -2x \\ \hline -y = -2x + 9 \\ -1 \quad -1 \quad -1 \end{array}$$

$$y = 2x - 9$$

2<sup>nd</sup> Substitute the expression from that equation into the other equation and solve.

\* Substitute  $2x - 9$  into the 1<sup>st</sup> equation for  $y$ \*

$$\begin{array}{r} 3x + 2(2x - 9) = 10 \\ 3x + 4x - 18 = 10 \\ \underline{7x} \quad \underline{4x} \quad -18 = 10 \\ 7x - 18 = 10 \\ \quad \quad +18 \quad +18 \end{array} \quad \begin{array}{r} 7x = 28 \\ \underline{7} \quad \underline{7} \\ x = 4 \end{array}$$

3<sup>rd</sup> Substitute the value found in step 2 back into the equation solved step one.

\* Plug  $x = 4$  back into the equation from step 1 ( $y = 2x - 9$ ) & solve for  $y$ \*

$$\begin{array}{r} y = 2(4) - 9 \\ = 8 - 9 \\ y = -1 \end{array}$$

**SOLUTION (4, -1)**

$$-x + y = 7$$

$$2x - 2y = -18$$

## You Try It!

1<sup>st</sup> Choose one equation and solve for x or y.

$$\begin{array}{r}
 x + y = 7 \\
 +x \qquad +x \\
 \hline
 y = x + 7
 \end{array}$$

2<sup>nd</sup> Substitute the expression from that equation into the other equation and solve.

$$2x - 2(x + 7) = -18$$

$$\begin{array}{r}
 \cancel{2x} - \cancel{2x} - 14 = -18 \\
 -14 = -18
 \end{array}$$

3<sup>rd</sup> Substitute the value found in step 2 back into the equation solved step one.

No solution

Problem:

$$3x + y = -1$$

$$-9x - 3y = 3$$

1<sup>st</sup> Choose one equation and solve for x or y.

$$\begin{array}{r}
 3x + y = -1 \\
 -3x \qquad -3x \\
 \hline
 y = -3x - 1
 \end{array}$$

2<sup>nd</sup> Substitute the expression from that equation into the other equation and solve.

$$-9x - 3(-3x - 1) = 3$$

$$\begin{array}{r}
 -9x + 9x + 3 = 3 \\
 3 = 3
 \end{array}$$

3<sup>rd</sup> Substitute the value found in step 2 back into the equation solved step one.
